Actisense New NMEA Buffer Receives Customer Endorsement

We have been delighted with feedback from our customers telling us that our new NMEA Buffer (NBF-3) is a good progression from the NBF-2 and sales of the unit certainly reflect that statement.

We've been manufacturing the NBF-2 for more than six years and get consistently great feedback from the market as to its quality and ease of use. Units have been installed on military vessels, super yachts and even in the automotive market and have sold successfully across the globe.

Our engineering team saw an opportunity to improve the Buffer without adding much extra cost and came up with a great new version, the NBF-3.

Using the new Actisense custom case, the NBF-3 has pluggable screw-terminal connectors to speed up installation, while the diagnostic LED on the input confirms correct connection.

The addition of power distribution for the NMEA 'talker' allows a single cable to connect power and data to the 'talker'. The internal PCB assembly is waterproof to IP66, while the removable connection cover provides excellent water resistance and wire strain relief.

A DIN rail mounting kit is also available for horizontal or vertical mounting options, adding to the easy installation.

Right now, the NBF-2 is still available; we anticipate that by May 2014 it will be out of production. It may be possible to order the NBF-2 after this time as an OEM product from us. If you have an ongoing requirement for the NBF-2 please contact us so we can understand your needs.
