Good things come in small packages: FUSION goes compact

As a global company, FUSION usually does everything on a large scale – but now, they’ve launched a product with all the features and technological innovation that they are known for, bundled up in a smaller package.

Introducing FUSION’s MS-RA50, the most compact True Marine stereo ever. Perfect for small boats, or anywhere that space is an issue (even jetskis!), this model needs only 55mm (2.17 inches) of mounting depth.

With a maximum output of 80 watts, the 2 channel stereo can power a set of speakers and provide excellent sound quality and volume, straight from the box. Or, if top power is your aim, it has Line out connections so you can add a FUSION amplifier, subwoofer and more speakers.

Despite its size, there is no compromising on features with the MS-RA50. In fact, the unit has several specifications that are usually only found in FUSION’s premium models. For a start, you can connect to either an iPod or iPhone and control your entire music library through the integrated user interface. With the FUSION Dock (MS-IPDOCKG2) you can keep your device charged and protected from the elements while it’s in use.

Also available is the FUSION MS-HUGMS gimbal mount bracket, which allows you to install the unit anywhere easily, without having to cut any mounting holes. Not only easy to install, once on the boat, this nifty little unit is a breeze to use.
Nearly all operations are controlled through the large Rotary Encoder and the customisable 2.3 inch LCD display enables you to easily read track and album information.

Like all True Marine products, the MS-RA50 is fit for purpose, designed specifically for use on the water, tested for protection against the elements and certified as IPx5 water-resistant, both front and back.

An ideal entry level option, the MS-RA50 is in a class of its own. For more information about the MS-RA50 or associated products, visit www.fusionelectronics.com.
